

THE SHIFT

Commerce is moving inside the AI apps consumers already use.

OpenAI now hosts dedicated **ChatGPT Apps** that let users discover, compare, and shop a retailer's catalog directly inside the chat. Google is building branded shopping into Gemini through its **Business Agent**. Anthropic shipped **Claude Connectors** for in-chat shopping. For retailers, this is not a feature to watch. It is a new storefront to show up in.

WHY QSR

QSR diners arrive in chat with intent, not a search query: hungry now, a familiar order in mind, a quick decision. The AI compresses in one turn what most apps stretch across screens – remembered favorites, combos and sides, local promotions, pickup vs delivery.

That's why the first wave of consumer AI ordering apps in 2026 is QSR-led.

FISHBONE

Connecting QSR brands' ordering ecosystems to the AI platforms consumers consolidate around.

Consumers increasingly use AI assistants as personal butlers, for planning, research, and ordering. The trend is consolidation toward these platforms. Fishbone connects a QSR brand's menu, voice, and ordering stack into this shift so they show up where customers are already there, enabling everything from menu discovery and personalization to cart construction to checkout, all on top of the brand's existing infrastructure. Nothing gets replaced. The QSR brand stays in control.
